

PRODUCT SHEET

CyberBoard

Your plant's dashboard, designed for the people who use it.

CyberBoard shows your plant in a simple, clear way: the status of motors, pumps and sensors, controls, schedules and alarms – with icons, colours and charts shaped around your plant. It's not a SCADA full of numbers for technicians only: it's a dashboard designed for the customer, showing what really matters, from smartphone, tablet or desktop.

AT A GLANCE

Your plant, clear and within reach

Status in the clear

See at once whether motors, pumps and sensors are working: icons and colours instead of tables of numbers. Understand how the plant is doing in an instant, without being a technician.

Schedules and automations

The built-in scheduler handles the plant's automatic operations: set the times and the functions start on their own – for example a pool's filtration, lights and cycles.

Readable alarms

The alerts that matter, filtered and explained: the customer gets the useful information without being buried under the machine's technical details.

Tailored to your plant

The dashboard is built with icons, colours and charts customised on what the plant actually does – a pool, a machine, a line: each one its own.

Simple controls

Clear buttons to activate the plant's functions: an interface anyone can use, not just those who know the machine in detail.

Always with you

A web app from smartphone, tablet or desktop: no app to install, the plant always within reach, inside and outside the facility.

CyberBoard

ADAPTS TO WHO'S LOOKING

One dashboard, two reading levels

For the customer

CyberBoard recognises who logs in and shows the end customer the essential information: what the plant is doing, whether all is well, the basic controls. Clear, with no needless complexity.

For the technician

At the same address, for a technician the dashboard opens deeper information – data closer to the machine's structure, useful as a first look to see whether something is wrong, before stepping in with dedicated tools.

CONNECTS TO ANY PLANT

One dashboard, whatever your machine

CyberBoard adapts to any kind of plant: XSide's Edge computing gathers data from the most diverse devices and translates it into a single language, ready to be shown simply on the dashboard.

Hardware and software are born together, designed and manufactured in Italy. A single supplier, a single philosophy: security, performance, practicality – and, above all, simplicity for the people who use them.

Your factory, in real time.
