

PRODUCT SHEET

XCenter

Access, share and manage: everything you need, in a single solution.

XCenter is a scalable, customisable platform specifically for OEMs: it manages the devices in use and enables the control and distribution of services. You see the status of every machine and give each operator the access appropriate to their level of expertise. Every access and activity is logged, for maximum security.

FEATURES

The nerve centre of your information

Deploy

It deploys and manages XSide fleets and the machinery connected to them, wherever they are.

Update management

It distributes updates to devices in the field, individually or in bulk.

Database management

It synchronises databases across different devices, keeping data consistent across the whole fleet.

WHY CHOOSE IT

Access. Share. Manage.

Access

Over the internet you access your machinery and plants, their data and their features, with no geographical limits.

Service distribution

It distributes and manages the services available on every XSide, making them accessible via the web.

User management

It creates users with specific profiles (technician, distributor, operator...) and associates machinery with users, individually or in bulk.

Activity log

It records all activities of every user and the safety checks; it measures the timing and effectiveness of interventions.

Share

Customers, technicians, suppliers and developers share multiple plants based on needs and skills.

XCenter

Manage

Monitor all activities, change service access levels, keep control of what is happening.

Access, share, manage.
